

Stop Targeted Attacks Before They Stop Your Business.

- Agentless
- Noiseless
- Scalable
- Self-managing
- Risk-aware

Most organizations have invested for decades in security technologies, frameworks, and cyber talent—yet devastating cyber incidents still occur. Advanced attackers slip past even the best tuned security controls and move under cover for weeks or months until they reach a company's prized assets. Then, in seconds, they can compromise data, disrupt services, and steal money or intellectual property. A targeted attack too often becomes a business crisis.

Illusive covers your entire system environment with adaptive deceptions. It is a featherweight, automated solution to inhibit the ability of attackers to move through your network and stop them before they can reach critical assets.

With Illusive, there is a 99% probability of detecting an attacker within three lateral movements.

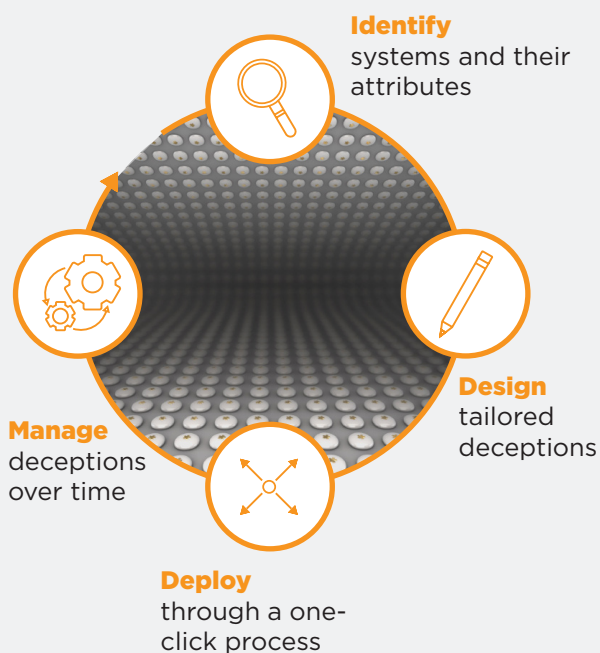

Deceptions Everywhere[®]: Empowering Defenders to Take Control

Once they've found a way in, adversaries investigate their surroundings to find data, user credentials and connection pathways to get from one system to another. But what if the information and objects they try to use don't really exist? With one erroneous move, the attacker is detected and forensic data is collected. The defender is now in control.

See Your World through the Attacker's Eyes

Illusive automatically identifies all endpoints and servers, connection paths between them, and credentials that facilitate attacker movement. From the Illusive console, incident responders can see exactly where the attacker is in relation to the organization's "Crown Jewels." With risk-aware visibility and granular incident details, they have the insight they need—and have bought themselves time—to take effective action to stop the attack while minimizing impact to the business. During ongoing operations, they can also proactively identify attack risk factors to reduce the ability of attackers to move across the environment.

AI-Driven Automation Powers a Nimble, Featherweight Solution

To be effective, deceptions must be:

- **Enticing** to the attacker
- **Transparent** to authorized users
- **Realistic** and tailored to your organization's DNA
- **Adaptive** to business changes and threat evolution
- **Pervasive** across the infrastructure
- **Scalable** and elastic to support large environments

Powered by Illusive's Deception Management System™, deceptions are perpetually designed, tuned and tailored so they appear—and remain—authentic to attackers.

Illusive Networks is a pioneer of deception technology, empowering security teams to take informed action against advanced, targeted cyberattacks by inhibiting and detecting the lateral movement of adversaries toward critical assets early in the attack process to prevent damage to the business.
